

# DevSecOps Implementation

Integrating security into CI/CD with developer-friendly workflows and measurable defect reduction.

## Situation

A product organization running many microservices needed security tooling that engineers would actually use, with clear triage and SLAs that matched release velocity.

## Approach

We prioritized pipeline integration points, ownership for findings, and exit criteria for blocking vs. advisory checks. Vendor selection emphasized API quality and developer experience, not checkbox counts.

## Outcomes

Faster remediation cycles, fewer recurring vulnerabilities in the same components, and reduced friction between AppSec and platform teams.

Quantify outcomes with your own data before external publication.
